So now what?

But that´s not the end of the story …

Carbanak returns

2015-09-02 21:32:52 | Peter Kruse

Short background

Just recently, CSIS carried out a forensic analysis involving a Microsoft Windows client that was compromised in an attempt to conduct fraudulent online banking transactions. As part of the forensic task, we managed to isolate a signed binary, which we later identified as a new Carbanak sample.

Casino hotel hack

At the end of August, we detected an attempt to compromise the network of a casino hotel in the USA. The infection vector used in this attack may have been a spearphishing e-mail with a malicious attachment using an RTF-exploit or .SCR file. The attackers' aim was to compromise PoS servers used in payment processing.
